# INTERNATIONAL AS PHYSICS

Unit 2 Electricity, waves and particles

Monday 10 January 2022

07:00 GMT

Time allowed: 2 hours

## **Materials**

For this paper you must have:

- a Data and Formulae Booklet as a loose insert
- a ruler with millimetre measurements
- a scientific calculator, which you are expected to use where appropriate
- a protractor.

### Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- All working must be shown.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.

## Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 80.

| For Examiner's Use |      |  |
|--------------------|------|--|
| Question           | Mark |  |
| 1                  |      |  |
| 2                  |      |  |

| TOTAL              |      |  |

# **Section A**

Answer all questions in this section.

| 0 | 1 | Lightning strikes can happen when there is a large potential difference between a cloud and the ground.  |
|---|---|--|
|   |   | The energy transferred during one lightning strike is $1.6 \times 10^9$ J. A charge of 23.7 C moves between the cloud and the ground in a time $t$ . The magnitude of the current is $3.09 \times 10^4$ A. |

Assume that the potential difference between the cloud and the ground is constant.

[1 mark]

| 0 1 . 2 | Calculate the potential difference between the cloud and the ground |
|---------|---|
|---------|---|

[1 mark]

**0 1 . 3** A power station has an electrical output of 1300 MW.

Calculate the time taken for the power station to transfer  $1.6\times 10^9~\mathrm{J}.$ 

[1 mark]

time taken = \_\_\_\_\_s

3

| 0 2 | A diffraction grating of width $42~\mathrm{mm}$ has $12~000$ lines. Monochromatic light is incident normally on the grating. The angle between the two second-order diffraction maxima is $41.4^\circ$ . |           | Do not write<br>outside the<br>box |
|-----|--|-----------|------------------------------------|
|     | Calculate the wavelength of the incident light.  | [4 marks] |                                    |
|     |  |           |                                    |
|     |  |           |                                    |

0 7

A wave travels along a stretched string and is reflected from a fixed end. The incident wave and the reflected wave interact to produce a stationary wave on the string.

Figure 2 shows part of the string, with the incident wave and the reflected wave at time t = 0

**P** is a point on the string.

The incident wave is shown as -

and the reflected wave is shown as —

Figure 2

The periodic time for one oscillation of the waves is T.

The amplitude of both the incident wave and the reflected wave is A.

State the displacement of the stationary wave at **P** at time t = 0

[1 mark]

displacement =

**Figure 3** shows the **incident** wave at time  $t = \frac{T}{4}$ .

Figure 3

**0** 7. **2** Draw on **Figure 4** the **reflected** wave at time  $t = \frac{T}{4}$ .

[1 mark]

Figure 4

 $\boxed{\textbf{0} \ \textbf{7}}.\boxed{\textbf{3}} \quad \text{Describe and explain the appearance of the stationary wave at time } t = \frac{T}{4}.$

0 8

**Figure 5** shows the variation of resistance  $R_{\rm T}$  with temperature for a thermistor. **Figure 6** shows the variation of resistance  $R_{\rm L}$  with light level for an LDR. **Figure 6** is plotted on logarithmic–linear axes.

Figure 5

Figure 6

**Figure 7** shows a circuit containing the LDR, the thermistor and a  $6.0~\rm V$  battery that has negligible internal resistance.

Figure 7

| 0 8 . 1 | The circuit is placed in shadow where the light level is <b>X</b> as shown in <b>Figure</b> | 9 6 |
|---------|---|-----|
|         | The temperature of the thermistor is 15 °C.   |     |

Determine the current in the circuit.

[4 marks]

| current = | Α |
|-----------|---|

0 8. The circuit is now placed in full sunlight where the light level is **Y** as shown in **Figure 6**.

The temperature changes so that the resistance of the thermistor is  $5.5 \ k\Omega$ .

Determine the potential difference across the thermistor.

[3 marks]

potential difference = V

7

0 9 Figure 8 shows a simple pendulum suspended from a ceiling that is too high to reach.

The height of the ceiling is H.

The centre of mass of the pendulum bob is a distance h from the floor when the pendulum is in the rest position.

Figure 8

A student uses the pendulum to determine H.

The relationship between h and the period T of the pendulum is:

$$T = 2\pi \sqrt{\frac{H - h}{g}}$$

The student wants to use a graphical method to determine both H and g.

| 0 9 . 1 | Describe the procedure that the student should use to collect data that prod | uce  |
|---------|--|------|
|         | accurate determinations of $H$ and $g$ .                                     |      |

Turn over for the next question

1 0

Earthquakes produce seismic waves that travel through the ground and make it vibrate.

**Figure 9** shows a seismograph  $S_1$  that is used to record these vibrations.

A heavy mass **M** is attached to a rigid case by a frictionless hinge.

**M** is supported by a spring that has a low stiffness.

The case is bolted to the ground.

Figure 9

During an earthquake the ground surface moves up and down but the centre of mass of **M** stays almost stationary.

**Figure 10** shows  $S_1$  bolted to the ground before the earthquake, with M at its equilibrium position.

Figures 11 and 12 show S<sub>1</sub> during the earthquake.

In **Figure 11** the ground has moved down but **M** has stayed in its initial position.

In **Figure 12** the ground has moved up and **M** remains in its initial position.

The pen records the movement of the seismograph on graph paper attached to a rotating drum.

Do not write outside the

Turn over for the next question

Questions **18** and **19** refer to two loudspeakers  $\mathbf{S_1}$  and  $\mathbf{S_2}$  separated by a distance of  $6.00~\mathrm{m}$ .

**1 8** Point **P** is 3.50 m from  $\mathbf{S}_1$  and 3.75 m from  $\mathbf{S}_2$ .

The speed of sound in air is  $330\ m\ s^{-1}$ .

The loudspeakers are in phase and emit sound of frequency  $660\ Hz$ .

The phase difference between the waves arriving at  ${\bf P}$  from  ${\bf S}_1$  and  ${\bf S}_2$  is:

[1 mark]

- A zero
- $\mathsf{B} \ \frac{\kappa}{4} \qquad \qquad \bigcirc$
- $\mathbf{C} \frac{\pi}{2}$
- **D** π

Do not write outside the box

**1 9** A path is parallel to the line joining  $\mathbf{S}_1$  and  $\mathbf{S}_2$  and is 40.0 m from that line.

The sound from both loudspeakers now has a wavelength of 0.70~m.  $\textbf{S_1}$  and  $\textbf{S_2}$  now emit waves that are  $\pi~rad$  out of phase.

The shortest distance along the path between a position with constructive interference and a position with destructive interference is x.

Point  ${\bf Q}$  is equidistant from  ${\bf S}_1$  and  ${\bf S}_2$ .

Which row gives x and the amplitude of the sound that is detected at **Q**?

[1 mark]

|   | <i>x  </i> m | Amplitude at Q |   |
|---|--------------|----------------|---|
| A | 2.3          | maximum        | 0 |
| В | 2.3          | minimum        | 0 |

|     |   |          |
|     |   |          |

Do not write outside the box

2 4 The diagram shows the spectrum for an X-ray tube.

The minimum wavelength  $\lambda_{\min}$  of X-rays emitted from the X-ray tube can be reduced by

[1 mark]

- A reducing the potential difference across the tube.
- **B** increasing the potential difference across the tube.
- C reducing the beam current in the tube.
- **D** increasing the beam current in the tube.

Turn over for the next question

In Questions **25** and **26**, a metal surface is illuminated with radiation of frequency f and photoelectrons are produced.

**2 5** The maximum kinetic energy  $E_{k(max)}$  of the photoelectrons is measured for a range of values of f.

The work function of the metal used is  $8.2 \times 10^{-19} \ J.$ 

Which graph shows the variation of  $E_{k(max)}$  with f?

[1 mark]

| Which <b>single</b> change will cause the stopping potential of the photoelectrons to in | ncrease?<br>[1 mark]  | Do not write<br>outside the<br>box  |
|--|---|---|
| A increasing the number of photons per second that are incident on the surface           | 0   |   |
| <b>B</b> increasing the wavelength of the incident radiation                             | 0   |   |
| C increasing the frequency of the incident radiation                                     | 0   |   |
| <b>D</b> using a metal of greater work function  | 0   | 14  |
|  | <ul> <li>A increasing the number of photons per second that are incident on the surface</li> <li>B increasing the wavelength of the incident radiation</li> <li>C increasing the frequency of the incident radiation</li> </ul> | A increasing the number of photons per second that are incident on the surface  B increasing the wavelength of the incident radiation  C increasing the frequency of the incident radiation |
